SecureVue®

The Unified Situational Awareness PlatformSM

SecureVue unifies next-generation SIEM, security configuration auditing, compliance automation and contextual forensic analysis into a single platform, delivering situational awareness, operational efficiency and the lowest total cost of ownership (TCO) for large enterprises.

Organizations continue to invest millions of dollars in evaluating and deploying new security products to protect IT assets against new types of attacks and new compliance products to keep pace with new regulations and policies - all with stagnant or shrinking budgets. Historically, organizations have relied on individual best-of-breed point products to address specific security and compliance requirements across the enterprise, including log management, SIEM, CMDB, asset management, configuration audit/assessment and forensic analysis tools.

While each of these best-of-breed point products does a good job of delivering value for a very specific function, unfortunately, these products do not “talk” to each other, leaving security and compliance professionals with multiple information “silos” that prohibit them from gaining visibility into the “big picture” of their IT environments. This inability to cross-correlate multiple types of information security data makes proactive discovery of broad-based, advanced persistent threats (APT) such as Stuxnet, identity and intellectual property theft, insider threats and other types of cyber attacks nearly impossible.

In addition to the ever-increasing threat of attacks, new and evolving regulations are becoming increasingly more prescriptive, requiring organizations to implement technologies that continuously monitor the environment for both unexpected security activity as well as continuous audit of security controls that focus on secure system configurations. Using a point product approach to try and address these critical business problems has resulted in spiraling costs for security and compliance management, forcing organizations to make hard choices between investing in new security technologies that improve security and being compliant.

To solve these critical challenges, organizations require a comprehensive security and compliance platform that enables them to:

- **Achieve true unified situational awareness** by having complete visibility across the enterprise by eliminating information silos
- **Reduce complexity** and minimize effort and operational overhead required to manage security and compliance for improved operational efficiency
- **Reduce Total Cost of Ownership (TCO)** by integrating multiple security and compliance functions into a single, simple platform

SecureVue from eIQnetworks is the first unified situational awareness platform to provide complete visibility and clarity across all enterprise data to address today’s critical information security and compliance needs. SecureVue overcomes the information gap inherent in best-of-breed products by capturing, analyzing and correlating all security

SecureVue Delivers Operational Efficiency

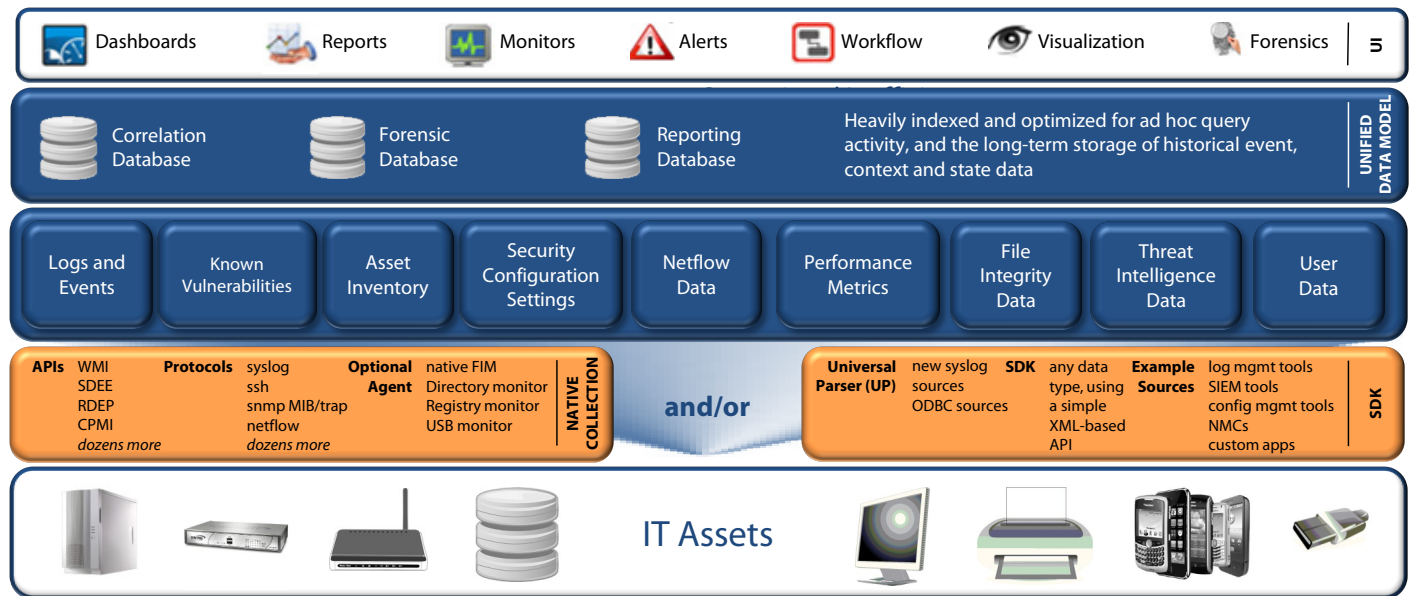

- Leverage existing investments in security and compliance
- Dramatically reduce complexity of tasks and management resources
- Keep security and compliance costs at a minimum

SecureVue Delivers Situational Awareness

- SecureVue brings together all security and compliance data in your environment to one console, turning random information into actionable intelligence.
- SecureVue delivers unsurpassed, real-time visibility and awareness across your enterprise IT environment to proactively monitor security and compliance like never before.

and compliance-related information from network devices, hosts and operating systems and applications in a single solution.

Unlike individual point products, SecureVue seamlessly captures the full range of enterprise security data, eliminates background noise and delivers a complete view of the enterprise to achieve true unified situational awareness. SecureVue natively collects, aggregates, analyzes, correlates and reports on all security and compliance data. Best of all, SecureVue works with the investments already made in security and compliance technologies, allowing organizations to leverage the data from existing point products. Using the built-in SDK (software development kit), SecureVue aggregates data from third party tools such as CMDB, SIEM, configuration audit, end-point security and others.

The major components of SecureVue's Unified Situational Awareness Platform include:

Next-Generation SIEM - SecureVue delivers all the capabilities needed for proactive security monitoring and protection including log management, SIEM (Security Information and Event Management), configuration analysis, Netflow analysis, file integrity monitoring, removable media monitoring, performance monitoring and vulnerability analysis. It correlates across multiple data types from multiple data sources to proactively identify new and evolving threats such as APT, cyber attacks, ID/IP thefts and many more.

Compliance Automation - SecureVue provides comprehensive compliance automation to centralize monitoring and reporting against regulations, best practices and standards for information security, dramatically reducing the time required to attest the state of security controls across the enterprise to internal and external auditors. SecureVue's compliance library includes:

- ISO 27001/2
- FISMA / NIST 800-53
- SOX / CoBIT
- PCI-DSS
- HIPAA / HITECH Act
- NERC CIP
- CIS Benchmarks
- DISA STIGs

“Situational awareness is needed by government and commercial security organizations for effective threat discovery and risk mitigation.”

- Gartner Analysts John Pescatore and Mark Nicollet,
"Delivering Situational Awareness"
(Gartner ID G00214313)

Security Configuration Auditing - SecureVue provides comprehensive configuration auditing across servers, desktops, network and security devices and applications to help organizations implement prescriptive configuration standards such as CIS benchmarks, DISA STIGs and customized minimum security requirements (MSRs). This helps improve overall security and proactively identify misconfigured systems, policy violations as well as unauthorized changes across the enterprise. SecureVue provides the capability to monitor and control a broad spectrum of controls.

Forensic Analysis - SecureVue allows a security analyst to search across all data in a single search to get a complete context. SecureVue can reduce root cause analysis times by up to 60%. With its intelligent security management and industry-leading single management console approach, SecureVue reduces complexity and minimizes effort and operational overhead required to manage security and compliance while reducing costs.

SecureVue – The Only Solution for Situational Awareness

SecureVue is the first and only unified situational awareness solution to provide real-time situational awareness capability across the largest enterprise networks and across the broadest range of security and compliance data. SecureVue's unified data model and multi-data correlation engine gives the unique ability to detect hard to find anomalies, while delivering unsurpassed scalability and reporting speed. SecureVue helps organizations to continuously collect, centralize, correlate and analyze critical information in real-time and identify anomalies, detect security breaches and policy violations proactively as they occur across the global infrastructure.

About eIQnetworks

eIQnetworks delivers unified situational awareness solutions for the largest enterprises around the world, including government, financial, telecommunications, retail and healthcare. The company's flagship solution, SecureVue®, is the only platform to provide a more accurate, in-depth view of an organization's security and compliance position via a single console through comprehensive, real-time security monitoring, compliance automation, configuration auditing and forensic analysis. Vital to the protection of an organization's infrastructure, the company's solutions proactively protect against cyber attacks, detect breaches and policy violations and respond to incidents and security controls, dramatically reducing total cost of ownership. eIQnetworks is a privately held company headquartered in Acton, Massachusetts.
